EPICODE

Web Development

Project Overview

You are required to develop a fully functional web application using HTML, CSS, and JavaScript. The project should emphasize JavaScript functionality and DOM manipulation, ensuring an interactive and dynamic user experience. The design must be responsive and accessible, following best web development practices

Your project must be a web application, not a static website. This means your app should be interactive, handle user inputs, and dynamically update the UI using JavaScript and DOM Manipulation. A static portfolio, or informational website will not be accepted

This practical project accounts for 50% of the final grade; the remaining 50% will be assessed through an oral examination

General Requirements

Project Theme

You are free to choose the theme of your application (e.g., a quiz game, e-commerce platform, etc.). No clones are allowed (e.g., Spotify-clone, Netflix-clone)

HTML Structure

Use semantic HTML5 elements to structure your pages
Include at least four different pages (plus one login page)

CSS Styling

Use Flexbox for layout
Implement responsive design with media queries
Use a consistent color scheme and typography

JavaScript Functionalities

Every page should implement event listeners for user interactions and dynamically modify the DOM by adding, removing, or updating elements

General Requirements

Navigation & User Experience

Implement a navigation menu that allows users to switch between pages

Provide feedback to users (e.g.,success/error messages)

Forms

Implement at least two forms with validation. Forms should simulate submit of data (print in terminal is enough)

Users

Your application must include a simulated user login system
Implement a simple fake login form that provides different UI states based on whether the user is "logged in" or not
Add a user profile page

External Data

Handle asynchronous operations using Fetch API to retrieve and display external data (e.g., consuming a public API like OpenWeather, JSONPlaceholder, or a similar service)

General Requirements

Submission Requirements

The project must be submitted via .zip file on LMS, including everything needed to run the application and a clear README.md explaining: project overview, features, etc

Optional Features

Implement CSS animations to enhance interactivity and user experience. Examples include transitions on user actions (hover, click) or animations during data loading

Add SEO metadata to optimize your app for search engines. Use <meta> tags for description, keywords, author, and other relevant information

Project Overview

❌ All general requirements are mandatory. Failure to meet these requirements will result in penalties in the final evaluation

✅ The optional features (bonus points) are not required but can contribute to a higher score if implemented effectively

This project is designed to test your knowledge of HTML, CSS, and JavaScript, with a strong emphasis on DOM manipulation and interactive features. Choose a project idea that interests you and make it your own while following the guidelines

Good luck and happy coding! 🚀
